

General Description (Domain and modeled aspects) :

We create the animal rescue and adoption management system to help animal shelters collect and organize information about animals. The domain of the application is **animal shelters**. We model the management of animals, volunteers, and adoption, donation and medical records in our domain.

Entities:

- animals(aid,species,age,found date, found location)
- rescue station:(address,environment, max capacity)
- adoptor:(name,phone#,e-mail)
- volunteer (id,total working hours,schedule,name)
 - lifecare volunteer(domain of responsibility)
- donator:(id,name,amount of donation)
- medical record(**aid,vaccinations, date, place)
- donation account(account id, balance, receive date, usage status)
- staff:(id,name,salary)

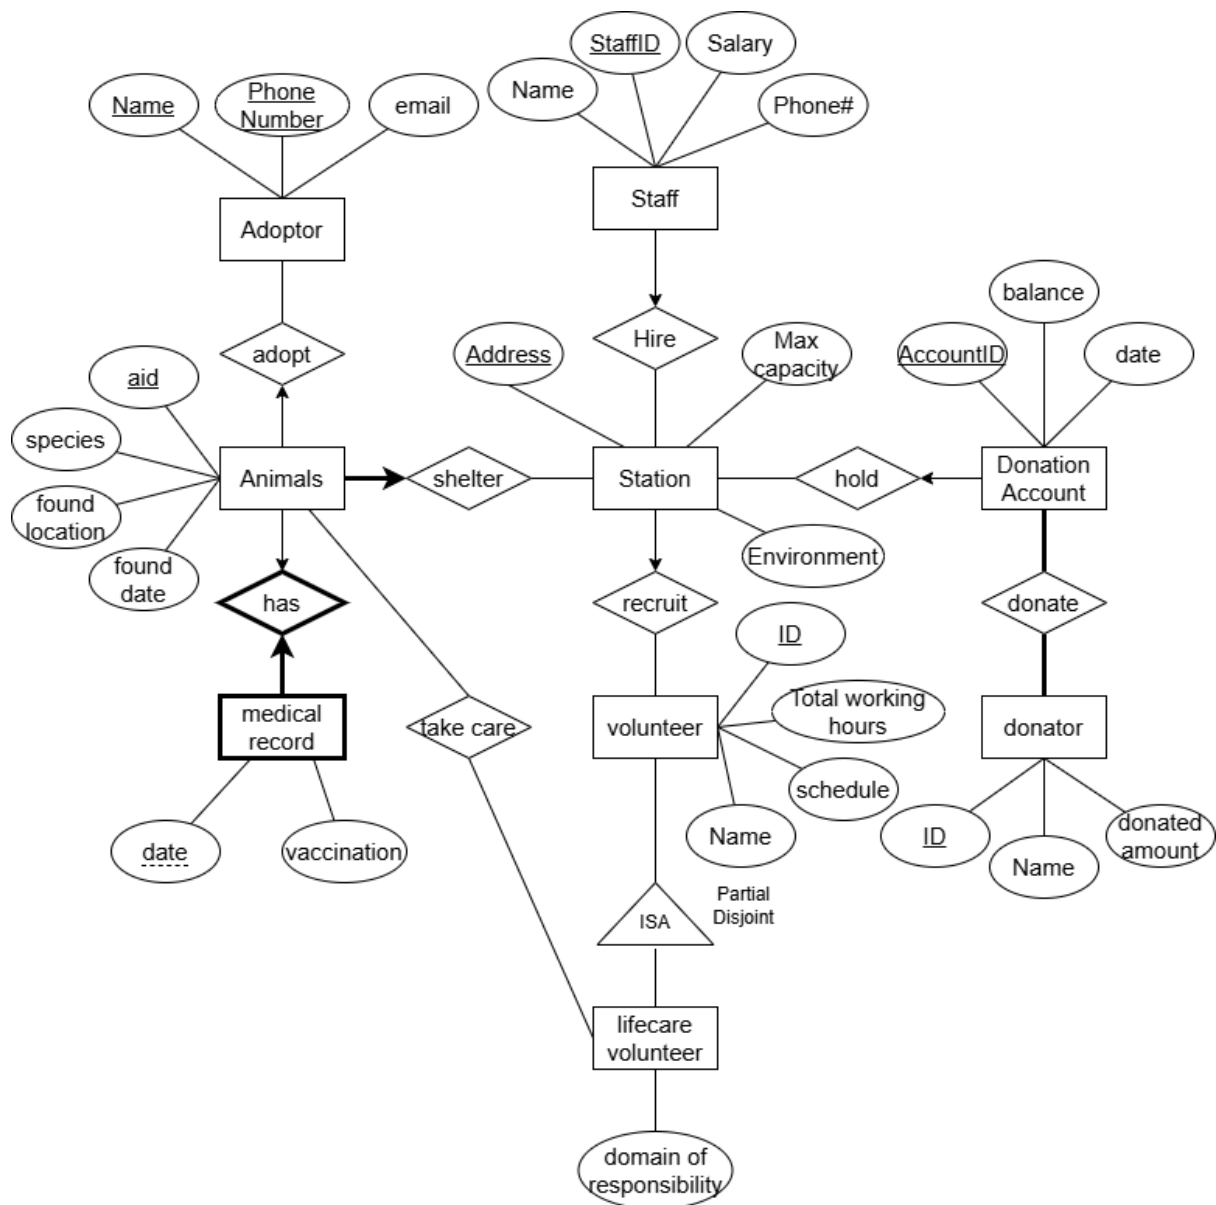

Database Specification:

- Animal Tracking: Stores and manages details of rescued animals, including their species, ages, medical records and current shelter location.
- Rescue Station Management: Monitors shelter locations and capacity to ensure proper housing for rescued animals.
- Adoption Management: Keeps records of adopters and their contact information to facilitate the adoption process.
- Volunteer Management: Tracks volunteer roles, work schedules, and contributions to the shelter.
- Medical Record Keeping: Logs vaccinations and medical treatments for rescued animals.
- Donation Management: Records financial contributions from donors, categorizing them by type and tracking how funds are used.

- Staff management: Collect the name ID and contact form of staffs and record the salary of each staff.

This system provides a structured and efficient way to manage animal rescue operations, ensuring better care for animals and improving adoption rates.
